$Ae^{-BT^{2}} = e^{\log A - BT^{2}} = e^{-T}$ $T = M\sqrt{\frac{\log A}{B}} \qquad e^{\log A - M^{2} \frac{\log A}{B} \cdot B} = e^{\log A \cdot (I-M^{2})}$

 $\therefore \ \mathbb{I}_1 \lesssim \sqrt{\frac{\log P}{n}} \ C_1(P)$

For I_2 , I_3 , I_4 , it's same as usual thresholding except, $Lij - Lij \le Lij (Lij)$

假设 kn→o, then everything is fine.
